

Network Services

Agility Business Solutions' network consultants understand the intricacies of network computing, but more importantly they understand the needs of manufacturers.

Networks should represent more than an expense, they should provide appreciable business value.

Networks should be:

- Fast and secure
- Fault tolerant
- Performing optimally
- Well organized
- Able to provide significant business value

Agility Business Solutions specializes in:

- Design and implementation of Local, Wide and Global Area Networks
- Network analysis and optimization
- Server performance monitoring and optimization
- Implementation of industry best-practices

Networks are more than just a way to access the internet, they are the place where critical business applications and vital customer information resides. Like a machine on the shop floor, when a network isn't functioning properly, a manufacturer is not running at optimal efficiency. A properly functioning network should do more than work, it should provide value to the organization and help support its goals.

Agility Business Solutions' network services group can help your company to better use technology, improve your network and more importantly enhance the information technology policies, practices and procedures throughout your enterprise.

Fast and Secure • Networks need to not only work, they need to work fast. In the information age speed is king! Network speed can even be a strategic advantage, for example, our clients often see a marked improvement in their 'time to quote' cycle.

In addition to being fast, it needs to be secure. Companies can lose critical customer data, intellectual property and even be financially liable for lapses in network security. It's important to make a network useable but also ensure the integrity of the data it is designed to protect. Networks face security threats every day such as viruses, hackers, malware, even attacks from disgruntled workers.

Fault Tolerance • Networks should be designed with fault tolerance in mind. Wherever possible, systems should be redundant with no single point of potential failure. Agility Business Solutions can help you design a highly fault tolerant network with good policies, procedures and practices related to backups and file storage.

Wide and Global Area Networks • Many manufacturers are expanding into new global markets, and while this presents great new opportunities, it also presents unique challenges. Connectivity with remote, global offices presents a number of challenges from expense to network performance and security. There are a number of viable solutions for remote connectivity and each comes with its own relative advantages and disadvantages.

System Optimization • Agility Business Solutions can help ensure that your file and print servers as well as servers used for Microsoft Exchange, Microsoft SQL and other mission critical systems are running at their best. Our team of professionals can keep your systems running at optimal performance and protect your information technology investment.

Where to start – A Network Discovery • Agility Business Solutions offers a free network discovery. This evaluation provides an overview of your systems and provides you with a deliverable, documenting our findings and recommendations.
